

Site Builder is a visual website builder inside Pilot. Create, edit, and publish websites for ACME Creative Agency — no coding required. Your site at acme-creative.air4.media is built and managed entirely from here.

Key Features

- **Simple Mode:** Chat with AI to build and edit your site in plain language — "Add a testimonials section" or "Change the hero headline" — preview updates instantly
- **Advanced Mode:** Five specialized tabs — Explorer (card grid), Chart (flowchart with mini-map), Design, Modules, and Menus — for full control over every detail
- **Draft & Live environments:** Edit freely in Draft without touching your live site; click **Go Live** to publish everything at once
- **Version history:** Click the camera icon to save a snapshot at any point; restore any previous version to roll back
- **AI site generation:** Enter your business details, browse generated design variations, choose Claude or GPT, and let AI build your full site
- **Design Editor:** Set brand colors, fonts, logos, social links, form styles, and custom CSS — all pages inherit your settings automatically
- **Modules:** Toggle on AirBlog, AirShop, AirPortal (client portal), AirChat, AirBook, AirForms, and more — each gets its own URL path and theme
- **Menus Editor:** Build named menus, add pages or custom links, drag to reorder, and assign

to Top Bar, Sidebar, or Footer locations

How to Use

1. Open Site Builder — you land in **Simple Mode** with a chat panel and live preview side by side
2. To build with AI, click **Build with AI**: enter your company name, industry, brand colors, and service description; optionally paste reference site URLs for design inspiration; select Claude or GPT
3. Browse the generated design variations, click **Try Another Design** for fresh options, then click **Build My Site** to generate all pages and content
4. Switch to **Advanced Mode** to fine-tune: open **Design** to configure colors, fonts, and logos; **Modules** to enable features; **Menus** to set up navigation
5. In Explorer or Chart, right-click any page to edit, duplicate, add a child, preview, publish/unpublish, or delete; drag pages in Chart to reorder the site hierarchy
6. Use **More Actions** to scaffold a starter structure, apply a template, generate a sitemap, import from a live URL, or browse version history
7. Click **Go Live** to push your full draft live, or right-click individual pages to publish them one at a time

Tips

- Use Simple Mode to build quickly with AI, then switch to Advanced for fine-tuning
- Set your Design tokens first — colors and fonts apply site-wide, so you only need to configure them once
- Save your finished design as a template to reuse it on future sites
- AirPortal supports three hosting modes: **Starter** (air4.media-hosted), **Business** (your domain/portal path), and **Enterprise** (fully custom domain) — configure in the Modules tab
- After enabling or disabling modules, click **Apply Rewrite Rules** to activate the updated URL routing instantly
- The AirPortal module lets your clients — like those ACME Creative Agency serves — log in to view invoices, projects, contracts, and documents in one place
- Your AI credit balance is shown before every AI action; page edits cost 2–3 credits, and a full AI site build costs 27 credits total
